A Markov chain is a mathematical system that experiences transitions from one state to another according to certain probabilistic rules. The defining characteristic of a Markov chain is that no matter how the process arrived at its present state, the possible future states are fixed.

p_{ij} denotes the probability that the chain, whenever in state i , moves next (one unit of time later) into state j , and is referred to as a one-step transition probability. $0 \leq p_{ij} \leq 1$: The defining Markov property (1) can be described in words as the future is independent of the past

In a study of the gasoline mileage of model year 2016 automobiles, the mean miles per gallon was 27.5 and the median was 26.8. The smallest value in the study was 12.70 miles per gallon, and the largest was 50.20. The first and third quartiles were 17.95 and 35.45 miles per gallon, respectively. Determine the type of skewness.
